

The Webex Multi-Content Solution for healthcare

In order to agree on a treatment plan for a patient, many specialists need to be involved. It is often hard to find all the necessary expertise in one single healthcare facility.

Gathering the right competence, at the right time, with the right decision material presented in a structured way has many great benefits:

Increases the quality of medical decisions and the quality of patient care.

Dramatically reduces the time in delivering the best possible treatment.

Increases knowledge sharing between professionals.

Getting the right expertise in the same physical room is not always possible. The Webex Multi-Content Solution brings people together in the same virtual room, allowing professionals to work as one integrated team, rather than reviewing different types of materials in sequence.

Webex has collaborated with Oslo University Hospital to develop the Webex Multi-Content Solution. The Webex Multi-Content Solution is a videoconferencing solution that allows you to share multiple content sources simultaneously. It brings people together in

the same virtual room, allowing professionals to work as one integrated team, rather than reviewing different types of materials in sequence. Through using the Webex Multi-Content Solution, Oslo University Hospital saw tremendous gains in the quality of their treatment and the productivity of their teams. They were able to gather dispersed teams of highly qualified specialists that included surgeons, oncologists, radiologists, pathologists from 5+ different locations in virtual meetings. These types of Multi-Disciplinary Team meetings are typically called MDT meetings, tumor boards or cancer boards.

There are three different possibilities with this solution in a healthcare scenario:

The doctors can show up to four different content sources at the same time.

For example: MRI-scans, pathology results, Electronic Patient Journal (EPJ) info or any other content source.

They can scroll through series of MRI-scans comparing the tumor at two different points in time.

If doctors want to have a closer look at one of the four elements, they can choose to display this element across all the four screens.

Share one stream of content through the screen from a laptop through a HDMI cable.

The laptop screen will then be displayed across all four content screens as one.

What does the Webex Multi-Content Solution consist of?

Supplied by Cisco:

- Webex Room Kit Pro
- Cisco Ceiling Microphone
- Device registration subscription
- Webex by Cisco or Cisco Meeting Server

Supplied by Partner:

- 1x monitor for participant video
- 1x or 4x monitors for content configured as 4K video wall
- HDMI-to-SDI converter
